

Part No: AGVLBD258A

Description

Evaluation Board for GVLB258.A with TFM.110A

Features:

Optimum Active Electronics Design for Passive GNSS L1/L5 Antenna Integrated TFM Module and Hybrid Coupler Bands Covered:

- BeiDou (B1)
- GPS/QZSS (L1/L5)
- GLONASS (G1
- Galileo (E1/E5a)

RoHS & Reach Compliant

1. Introduction

Taoglas GNSS Reference Design Evaluation Boards

The Taoglas series of GNSS Antenna Reference Boards are designed to show the optimum component layout and make it easy for you to integrate the active electronics with the passive GNSS antenna on your device PCB.

Designing active GNSS electronics can be difficult, but utilising Taoglas' **TFM Series** of front end active electronics and hybrid couplers allow you to achieve the best possible positioning performance for your device. The Taoglas TFM module features a SAW/LNA/SAW/LNA topology in both the low and high band signal paths to prevent unwanted out-of-band interference from overdriving the GNSS LNAs or receiver.

Features and Benefits of utilising the TFM Modules.

Ease-of-integration – Single-package solution combines impedance matching, filter efficiency and low noise design for easy, drop-in use with any antenna or GNSS receiver

Low-noise System Design – Integrated pre-filters deliver exceptional out-of-band rejection across multiple band configurations and neighbouring interference to properly set noise figure

Dual-gain Stage Architecture – Cascaded LNAs, pre-filters and optimized impedance matching deliver sufficient gain to the GNSS receiver without signal-to-noise overload

Low-profile Form Factor – Small footprint and low-profile design saves valuable real estate without the need for external components and routing

Accelerated Development Cycles – 2+ years of development by antenna and RF design experts, delivering the highest levels of integration, manufacturability and robustness in a single package

Where used, the Taoglas **HC125A** is a low profile, high performance, 3dB hybrid coupler designed for multifeed Multiband GNSS applications. The HC125.A is ideal for applications where balanced power and low noise amplifiers are required. For more information on the HC125A, visit the product page here.

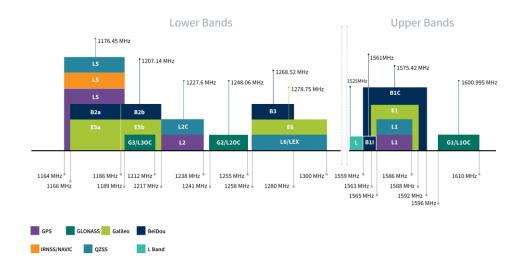

Please visit the standard product page for the HP54510.A to download the integration files in Altium, 2D and 3D formats for your project by clicking here.

For more information or to order samples, reach out to your regional Taoglas customer support team.

2. Specification

GNSS Frequency Bands					
GPS	L1 1575.42 MHz	L2 1227.6 MHz	L5 1176.45 MHz

4. Integration Guide

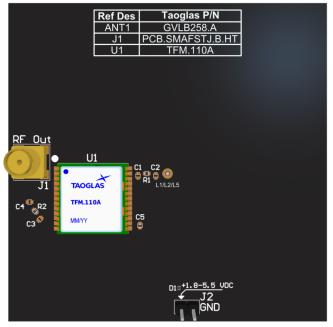

The following is an example on how to integrate the TFM.110A into a design. In this example, the GVLB258.A is used as the antenna. This antenna has one pin, which is used for the L1/L2/L5 bands. The TFM.110A is powered from a separate power DC supply (1.8V-5.5V). The output of the TFM.110A can then be fed to a relevant GNSS receiver module. Taoglas recommends using a minimum of 70x70mm ground plane (PCB) to ensure optimal performance.

Front End Active Electronics Module

Block Diagram of integration of the TFM.110A

Top and bottom view of PCB.

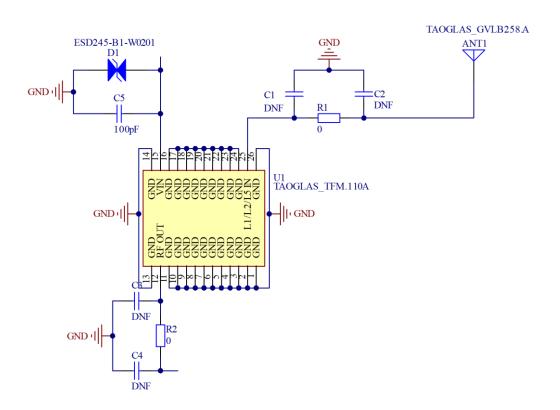

4.1 Schematic Layout

Matching components with the <u>TFM.110A</u> are required for the module to have optimal performance in the spaces specified in the schematic below. Additional matching components may be necessary for your device, Taoglas recommends incorporating extra component footprints, forming a "pi" network, between the <u>TFM.110A</u> and the antenna. Matching components should also be placed between the RF output pin and the GNSS receiver module input pin.

Taoglas recommends placing an ESD diode and decoupling capacitor (100pF) on the input pin of the supply rail.

Note: The RF In & RF out of the TFM module are all DC-blocked internally. External DC block capacitors are not required.

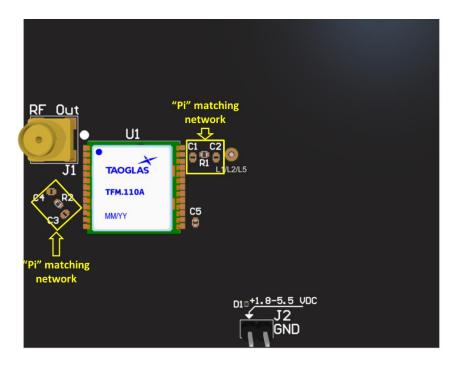

Schematic above shows how the TFM.110A and GVLB258.A are integrated.

Designator	Туре	Value	Manufacturer	Manufacturer Part Number
C1, C2, C4, C5	Capacitor	Not Fitted	-	-
C3	Capacitor	100pF	Murata	GRM1555C1H101JA01D
D1	Diode	-	Infineon	ESD245B1W0201E6327XTSA1
R1, R2	Resistor	0 Ohms	YAGEO	RC0402JR-070RL

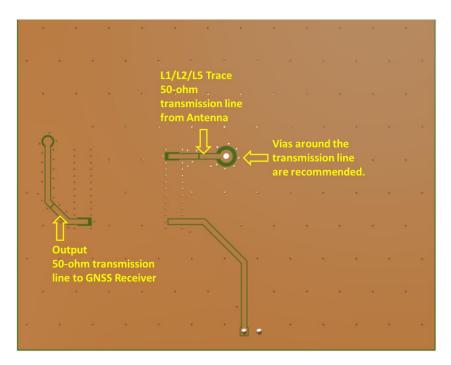

4.2 Reference Design Integration

The TFM.110A should be placed as close to the signal input and output as possible to shorten the length of the transmission lines. The RF IN/OUT traces must maintain a 50 Ohm transmission line. A Pi Matching Network is recommended for the RF IN transmission lines, the values and components for the matching circuit will depend on the tuning needed. Ground vias should be placed beside each ground pad and the DC Voltage input should be between +1.8 and +5.5 VDC. It's recommended that the DC Voltage input should be coupled with a 100pF Capacitor and an ESD Diode.

Bottom view of the PCB, showing "Pi" matching network.

Bottom view of the PCB, showing transmission lines and integration notes.

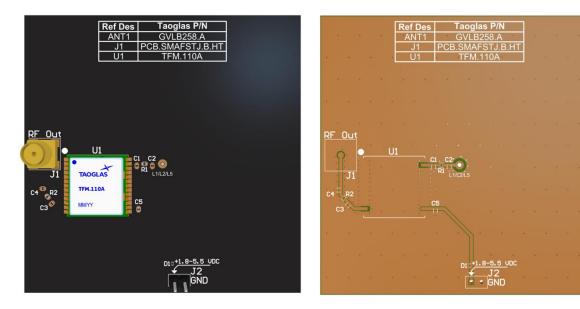

4.3 Final Integration

The bottom side image shown below highlights the antenna connection to the TFM.110A module. It demonstrates the output of the TFM.110A module that needs to be connected to a GNSS receiver input. It displays the DC connection required with ESD diode and decoupling capacitor. Taoglas recommends using a minimum of 70x70mm ground plane (PCB) to ensure optimal performance.
